                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            neuropilins but also with KDR/FLK-1 and Fitl. The soluble NPs may also act as dominant negative receptors when expressed in cells by dimerizing with intact neuropilin receptors. The soluble neuropilins are useful for treatment of diseases or disorders associated with YBGF, e.g. metastasis, inappropriate angiogenesis, chronic inflammation, diabetic retinopathy and arthritis. Solid tumors can also be treated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 14-SEP-1999 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents the human YEEF(165)R/NFD (or neuropilin-2). The invention relates to a neuropilin and constitution relates to a neuropilin and has YEEF antagonist to activity as determined by the human mabilical vein endotherical cell (HMYDC) polification assay using YEEF185. The neuropilin antagonist (semaphorin/collapsin family member) is useful for treatment of a disease or disorder associated with YEEF, including cances used as metastic concert and amploquests diseases (diseases diseases).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Novel nucleic acid encoding human CUB-domain containing protein, useful for drug screening, diagnosis and treatment of physiological disorders WPI; 2001-290917/30. Donoho G, Turner CA, Nehls M, Friedrich G, Zambrowicz B, Sands AT;

Claim 1; Page 27; 33pp; English.

or diseases -

The sequence represents a polynucleotide which encodes a novel human protein (NHP) containing a CUB domain (an extracellular domain). CUB proteins have been associated with regulating development, modulating cellular processes and preventing infectious disease. NHP nucleotide sequences are useful for gene therapy of physiological disorders or consening libraries and assessing gene patterns. NHP pulceotide sequences care useful for detecting mutant or inappropriately expressed NHPs (for cerample, those proteins associated with obesity, high blood pressure, connective tissue disorders and intertility) for the diagnosis of a disease. The polynucleotides may also be used in screening for drugs effective in the treatment of symptomatic or phenotypic manifestations of concentrate in the normal function of NHP in the body. Nucleotide constructs care speciation of compounds that bind to NHP receptors or trigger culentification of compounds that bind to NHP receptors or trigger culentification of compounds that bind to NHP receptors or trigger

regulating cellular processes New isolated nucleic acid molecule for diagnosis, therapy of human and other animal disorder, or as prevention, and modulating agen agent

Claim 1; Fig 1; 263pp; English.

The sequence represents a cDNA which encodes human TANGO 229 polypeptide. This protein and similar others exhibit the ability to affect growth, proliferation, survival, differentiation, activity, morphology, or movement/majoration of, e.g. T cells and cells of the heart, liver, pancreas, placenta, brain, lung, skeletal muscle, kidney, spleen, lymph node, peripheral blood leukocyte, bone marrow or thymus tissue. They can be used as modulating agents for regulating cellular processes, thus, the proteins and their associated nucleic acids can be used to prognosticate, prevent, diagnose, or treat disorders associated with physiological prevent, diagnose, or treat disorders associated with physiological disorders include abnormal blood coagulation,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC proteins have been associated with regulating development, modulating cellular processes and preventing infectious disease. NHP nucleotide consequences are useful for gene therapy of physiological disorders or consective those proteins associated with negulating development, modulating cellular processes and preventing infectious disease. NHP nucleotide sequences consecting thraries and assessing gene patterns. NHP nucleotide sequences are useful for detecting matant or inappropriately expressed NHPs (for connective tissue disorders and infertility) for the dispused of connective tissue disorders and infertility for the dispussion of connective tissue disorders and infertility for the dispussion of connective tissue disorders and infertility for the dispussion of connective tissue disorders and infertility for the dispussion of connective tissue disorders may also be used in screening for drugs connective in the treatment of symptomatic or phenotypic manifestations of confective in the treatment of symptomatic or phenotypic manifestations of ceffective in the treatment of symptomatic or phenotypic manifestations of concerning the normal function of NHP in the body. Nucleotide constructs or types as such products in vivo. These host cells allow for the cells to dentification of compounds that bind to NHP receptors or trigger
                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AT:
```

The sequence represents a polynuclotide which encodes a novel human protein (NHP) containing a CUB domain (an extracellular domain). CUB protein have been associated with regulating development, modulating cellular processes and preventing infectious disease. NHP nucleotide sequences are useful for gene therapy of physiological disorders or diseases. NHP oligonucleotides are useful as hybridisation probes for screening librories and assessing gene patterns. NHP nucleotide sequences are useful for detecting mutant or inappropriately expressed NHPs (for example, those proteins associated with obesity high blood pressure, connective tissue disorders and infertility) for the diagnosis of a disease. The polynucleotides may also be used in screening for drugs effective in the treatment of symptomatic or phenotypic manifestations of

                              perturbing the normal function of NHP in the body. Nucleotide constructs encoding NHP products are used to genetically engineer host cells to express such products in vivo. These host cells allow for the identification of compounds that bind to NHP receptors or trigger NHP mediated pathways.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            corresponding ligands or receptors, to quantify levels of protein or cognate corresponding ligand or receptors, as antinflamentory agents, and in compositions for the treatment of skin, connective tissue and immune system diseases. The polynucleotide is useful as marker for tissue, as a chromosome marker or tags in the identification of a genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a polynucleotide sequence which is isolated from lymph node stromal cells of fsn -/- mice. The polynucleotides and their polypepides are useful for treating an inflammatory disorder, disorder of immune system and cancer selected from epithelial, lymphold, myelold, stromal and neuronal cancers, a viral disorder, in particular HIV infection and for modulating the growth of blood vessels. The polypepides are useful for treating a tumour necrosis factor (TNV) mediated disorder, such as those selected from arthritis, inflammatory bowel disease and cardiac failure and a fibroblast growth factor-mediated disorder. It is also useful in assays to determine biological activity, to raise antibodies, to isolate

the proteins are collectively known as colon cancer antigens, the colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectlying mutations or deletions in a pattent's genome that affect the activity of P by expressing inactive proteins or to supplement the pattents own production of P. Additionally, N may be used to produce the oclon cancer associated Ps. by inserting the nucleic acids into a host cell and culturing the call to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AMH37196 to AMH37204

                         This sequence represents an expressed sequence tag (EST), and is a polynucleotide of the invention. The polynucleotides of the invention are all secreted EST sequences isolated from a variety of human tissue sources: The EST sequences and proteins encoded by them are predicted to have useful bloogical activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, haematopolesis regulating activity, tissue growth activity, haematopolesis regulating activity, the supporting data is given activity, the activity, haematopolesis regulating activity, the providence for activity, anti-inflammatory activity, catherinthumour invasion suppressor activity, anti-inflammatory activity, adherinthumour invasion suppressor activity, anti-inflammatory activity, adherinthumour invasion suppressor activity.
                                                                                                                                                                                                                                                                                            New polynuclectides encoding human secreted proteins - derived e.g. human blood, kidney, foetal lung, placenta, testes, brain ovary, pituitary, retina and colon cDNA libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Expressed sequence tag; secreted protein; haematopoiesis regulator; tissue growth; activin; inhibin; tumour invasion suppressor; EST; h chemotaxis; chemotaxis; gene therapy; thrombolysis; receptor; ligand; anti-inflammatory; tumour inhibitor; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S X
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
The present sequence is a cDNA encoding human Factor 8 homologue (F8H) which is a coagulation cofactor. The protein is selectively expressed in haematopoletic, heart and reproductive tissues. It has haemastatic and cerebroprotective activities. The F8H contains a Factor 5/8 signature and is useful as a therapeutic for treating coagulation related diseases such as haemophilia and stroke. The nucleic acid is useful as hybridisation probe and amplification primer for detecting deficiencies
                                                                                                                                                                                                                                                                                                                                                                                                                                           04-JUL-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence

                                                                          in the level of F8H mRNA, for screening F8H gene mutations and for monitoring regulation of gene expression. Fragments of the nucleic aci are also useful as diagnostic probes and primers, and can be used in screening methods such as those using DNA chips. The present sequence also useful as a target to screen therapeutically useful modulators

Matches 189; Conserv cancer associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in generic therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with happropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer associated Ps. by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and AAR77789 represent sequences used in the exemplification of the recent invariance. 1206 gaagacctataaaggaattgtgaataa-tgaagaaaaggtgtttcagggtaactctaact 1264 N.B.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes transgenic mice (I) and (II) containing modifications in the factor V gene, where (I) expresses an activated protein C (ARC) resistant factor V and (II) lacks the ability to express vild-type factor V. The transgenic animals (I) and (II) are useful for screening compounds with anticoagulant activity. Methods from the present invention, and the transgenic animals, are also useful in providing models for human thrombophilla. These models are useful in providing insight into the basic regulatory mechanisms of blood coagulation and pathogenesis of human thrombosis. In addition, factor V.null transgenic mice, especially pregnant females may be used as a model system to rest in utero gene replacement therapy protocols. The present sequence represents a human factor V cDNA sequence, which is used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  6454
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                6340

                                                                                                                                                                                                                                            The invention provides a method for the discrimination of the gene polymorphism of human vth aggregation factor, where one of the following (1) to (6)) residues/noucleotides in the aggregation gene is discriminated in the patient to be tested :(1) residue 495: guanine (3) or adenine (A), (2) residue 642: (3) or thymine (7), (3) residue 2663: (6) or (A), (4) residue 2763: (6) or (A), (5) residue 2863: (A) or (G), (6) residue 5112: (A) or (G), The method is useful in the genetic diagnosis of a diabetes patient. The method uses FCR-SGC (fluorescence-based polymerase chain reaction-single strand conformation polymorphism) for analyzing DNA samples for polymorphisms. The present sequence represents a cDNA encoding a human vth aggregation factor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  30-APR-1998;

A mutant human Factor V cDNA (AAT33948) has adenine at position 1691, whereas the normal cDNA (AAT33942) has guanine at this position. The substn. results in activated protein C resistance in humans. The mutation can be detected by CR amplification of the affected region (see also AAT33935, AAT33939-41) and analysis of the products (see also AAT3394-50), either by nucleotide sequencing or by differential digestion using MnII restriction endonuclease (see also AAT33937-38).
                                                                                                                                                                                                           Claim 22; Page 146-149; 175pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Key

L11 ANSWER 1 OF 1 HCAPLUS COPYRIGHT 2002 ACS DUPLICATE 1 Document No. 134:321614 Protein and cDNA sequences of a novel human CUB-domain containing protein and uses thereof in diagnosis, therapy and drug screening. Donoho, Gregory; Turner, C. Alexander, Jr.; Nehls. Michael; Friedrich, Glenn; Zambrowicz, Brian; Sands, Arthur T. (Lexicon Genetics Incorporated, USA). PCT Int. Appl. WO 2001029219 A1 20010426, 33 CY, DE, DK, ES, FI, FR, GA, GB, GR, IE, IT, LU, MC, ML, MR, NE, NL, PT, SE, SN, TD, TG. (English). CODEN: PIXXD2. APPLICATION: WO 2000-US28798 20001008. PRIORITY: US 1999-PV160285 19991019; US 2000-PV183583 20000218. This invention provides protein and cDNA sequences for newly identified human proteins, designated NHPs, which shares structural similarity with animal CUB domain proteins, coagulation factors V and XIII, milk fat globule-EGF factor 8, 5 transcriptional repressor AEbinding protein-1, and neuropilins 1 and 2 (which, like the presently described protein, contain both CUB and

Which, like the presently described protein, contain both CUB and discoidin domains). While NHP shares sequence homol. with other CUB-domain contg. proteins, its primary sequence is unique. Its expression is detected in human cell lines, and human prostate, pituitary, fetal brain, brain, thymus, spleen, lymph node, trachea, kidney, fetal liver, thyroid, adrenal gland, salivary gland, stomach, small intestine, colon, muscle, heart, mammary gland, adipose, skin, esophagus, bladder, cervix, rectum, and testis cells. In one embodiment, the invention relates to diagnostic assays for detecting diseases assocd. with inappropriate NHP activity or levels. Also disclosed are methods for utilizing NHP in drug screening assays and in therapy directed against diseases assocd. with inappropriate NHP activity or levels.

The invention provides cDNA and protein sequence of two novel human protein TANGO416 and TANGO457. The protein TANGO416 was cloned from human fetal spleen and has high homol. with murine protocadherin. Both proteins are transmembrane proteins and contq. extracellular, transmembrane and intracellular domain. These nucleic and proteins are useful for diagnosis, prevention, and therapy of a no. of human and other animal disorders. The invention also provides antisense nucleic acid mols., expression vectors contg. the nucleic acid mols. of the invention, host cells into which the expression vectors have been introduced, and non-human transgenic animals in which a nucleic acid mol. of the invention has been introduced or disrupted. The invention still further provides isolated polypeptides, fusion polypeptides, antigenic peptides and antibodies. Diagnostic, screening, and therapeutic methods using compns. of the invention are also provided. The nucleic acids and polypeptides of the present invention are useful as modulating agents in regulating a variety of cellular processes.

L40 ANSWER 4 OF 6 HCAPLUS COPYRIGHT 2002 ACS 2001:300759 Document No. 134:321609 Protein and cDNA sequences of human secretory proteins and uses thereof in diagnosis, therapy and drug screening. Turner, C. Alexander, Jr.; Donoho, Gregory; Nehls, Michael; Hilbun, Erin; Zambrowicz, Brian; Sands, Arthur T. (Lexicon Genetics Incorporated, USA). PCT Int. Appl. WO 2001029084 A2 20010426, 63 pp. DESIGNATED STATES: W: AE, AG, AL, AM, AT, AU, AZ, BA, BB, BG, BR, BY, BZ, CA, CH, CN, CR, CU, CZ, DE, DK, DM, DZ, EE, ES, FI, GB, GD, GE, GH, GM, HR, HU, ID, IL, IN, IS, JP, KE, KG, KP, KR, KZ, LC, LK, LR, LS, LT, LU, LV, MA, MD, MG, MK, MN, MW, MX, MZ, NO, NZ, PL, PT, RO, RU, SD, SE, SG, SI, SK, SL, TJ, TM, TR, TT, TZ, UA, UG, UZ, VN, YU, ZA, ZW, AM, AZ, BY, KG, KZ, MD, RU, TJ, TM; RW: AT, BE, BF, BJ, CF, CG, CH, CI, CM, CY, DE, DK, ES, FI, FR, GA, GB, GR, IE, IT, LU, MC, ML, MR, NE, NL, PT, SE, SN, TD, TG. human proteins belong to tumor necrosis factor receptor superfamily. Tada, Hideaki; Konishi, Mikio; Fukushima, Daikichi (Ono Pharmaceutical Co., Ltd., Japan). PCT Int. Appl. WO 9838304 A1 19980903, 54 pp. DESIGNATED STATES: W: JP, KR, US; RW: AT, BE, CH, DE, DK, ES, FI, FR, GB, GR, IE, IT, LU, MC, NL, PT, SE. (Japanese). CODEN: PIXXD2. APPLICATION: WO 1998-JP799 19980226. PRIORITY: JP 1997-43143 19970227. The cDNA for proteins OAF065.alpha. and OAF065.beta. are isolated from ΑB human stroma cell line HAS303. OAF065.alpha. consists of 416 and OAF065.beta. of 423 amino acids, with identical N-terminal 1-415 residues. The C-terminal Glu-Ala of OAF065.alpha. is substituted with 8 amino acid residues in OAF065.beta.. Both protein contains a Cys-rich domain, commonly seen in the extracellular domain of the TNF receptor superfamily. Claimed are methods of recombinant prepn. of the proteins, (monoclonal) antibody to the proteins, oligonucleotide hybridizing to the cDNA, and therapeutics contg. the protein and/or the antibodies.

L40 ANSWER 6 OF 6 MEDLINE DUPLICATE 1
96394649 Document Number: 96394649. PubMed ID: 8798755. Cloning and characterization of islet cell antigen-related protein-tyrosine phosphatase (PTP), a novel receptor-like PTP and autoantigen in insulin-dependent diabetes. Cui L; Yu W P; DeAizpurua H J; Schmidli R S; Pallen C J. (Cell Regulation Laboratory, Institute of Molecular and Cell Biology, National University of Singapore, 10 Kent Ridge Crescent, Singapore 0511, Republic of Singapore.) JOURNAL OF BIOLOGICAL CHEMISTRY, (1996 Oct 4) 271 (40) 24817-23. Journal code: 2985121R. ISSN: 0021-9258. Pub. country: United States. Language: English.

Cloning of the cDNA encoding a novel human protein- tyrosine phosphatase (PTP) called islet cell antigen-related PTP (IAR) predicts a receptor-like molecule with an extracellular domain of 614 amino acids containing a hydrophobic signal peptide, one potential N-glycosylation site, and an RGDS peptide which is a possible adhesive recognition sequence. The 376-amino acid intracellular region contains a single catalytic domain. Recombinant IAR polypeptide has phosphatase activity. Northern blot analysis shows tissue-specific expression of two IAR transcripts of 5.5 and 3. 7 kilobases, which are most abundant in brain and pancreas. The IAR PTP is homologous in its intracellular region to IA-2, a putative PTP that is an insulin-dependent diabetes mellitus (IDDM) autoantigen. IAR is also reactive with IDDM patient sera. IAR and IA-2 may distinguish different populations of IDDM autoantibodies since they identify overlapping but nonidentical sets of IDDM patients. Thus IAR is likely to be an islet cell antigen useful in the preclinical screening of individuals for risk of IDDM.

     Sol. heteromultimeric immunoadhesin fusion proteins that contain the
     extracellular ligand-binding domains of ErbB receptors oligomerized via
     the multimerization domains of Igs are described for use as
     antagonists of neuregulins in the control of cell proliferation,
     e.g. in cancers. Specifically, the extracellular
     domains of ErbB2 and ErbB3 or ErbB2 and ErbB4 are used in
     combination. The prepn. ErbB/IgG fusion proteins and the characterization
     of their heregulin binding properties is reported.

(English). CODEN: PIXXD2. APPLICATION: WO 2000-US31179 20001109. PRIORITY: US 1999-PV165260
- AB The cDNA sequences and corresponding deduced amino acid sequences of novel human proteases (NHPs) are disclosed. The NHP genes were obtained from a human testis cDNA library using probes and/or primers generated from human gene trapped sequence tags. The described NHPs share significant similarity to a variety of mammalian proteases, and esp. carboxypeptidase A. The NHPs can be used in therapeutic, diagnostic, and pharmacogenomic applications.

PRIORITY: US 1999-PV164624 19991110.
- The present invention relates to the discovery, identification, and characterization of novel human proteins which share structural similarity with calcium transporting ATPases and aminophospholipid transporters. The cDNA sequences and the corresponding deduced amino acid sequences of the human ATPase homologs are disclosed. The human ATPase homologs can be used in therapeutic, diagnostic, and pharmacogenomic applications.

- AB This invention provides protein and cDNA sequences for newly identified human proteins, designated NHPs, which share structural similarity with mammalian multi-drug resistance (MDR) proteins and cellular transporters. In one embodiment, the invention relates to diagnostic assays for detecting diseases assocd. with inappropriate NHP activity or levels.

			•
÷.			
	÷		
		2	

Also disclosed are methods for utilizing NHP in drug screening assays and in therapy directed against diseases assocd. with inappropriate NHP activity or levels. Seq ID No. 47 and 48 were claimed, but information was not provided.

L90 ANSWER 4 OF 10 HCAPLUS COPYRIGHT 2002 ACS DUPLICATE 4
2001:300872 Document No. 134:321614 Protein and cDNA sequences of a novel human CUB-domain containing protein and uses thereof in diagnosis, therapy and drug screening. Donoho, Gregory; Turner, C. Alexander, Jr.; Nehls, Michael; Friedrich, Glenn; Zambrowicz, Brian; Sands, Arthur T. (Lexicon Genetics Incorporated, USA). PCT Int. Appl. WO 2001029219 Al 20010426, 33 pp. DESIGNATED STATES: W: AE, AG, AL, AM, AT, AU, AZ, BA, BB, BG, BR, BY, BZ, CA, CH, CN, CR, CU, CZ, DE, DK, DM, DZ, EE, ES, FI, GB, GD, GE, GH, GM, HR, HU, ID, IL, IN, IS, JP, KE, KG, KP, KR, KZ, LC, LK, LR, LS, LT, LU, LV, MA, MD, MG, MK, MN, MW, MX, MZ, NO, NZ, PL, PT, RO, RU, SD, SE, SG, SI, SK, SL, TJ, TM, TR, TT, TZ, UA, UG, UZ, VN, YU, ZA, ZW, AM, AZ, BY, KG, KZ, MD, RU, TJ, TM; RW: AT, BE, BF, BJ, CF, CG, CH, CI, CM, CY, DE, DK, ES, FI, FR, GA, GB, GR, IE, IT, LU, MC, ML, MR, NE, NL, PT, SE, SN, TD, TG. (English). CODEN: PIXXD2. APPLICATION: WO 2000-PV183583 20000218.

AB This invention provides protein and cDNA sequences for newly identified human proteins, designated NHPs, which shares structural similarity with animal CUB domain proteins, coagulation factors V and XIII, milk fat globule-EGF factor 8, 5 transcriptional repressor AE-binding protein-1, and neuropilins 1 and 2 (which, like the presently described protein, contain both CUB and discoidin domains). While NHP shares sequence homol. with other CUB-domain contg. proteins, its primary sequence is unique. Its expression is detected in human cell lines, and human prostate, pituitary, fetal brain, brain, thymus, spleen, lymph node, trachea, kidney, fetal liver, thyroid, adrenal gland, salivary gland, stomach, small intestine, colon, muscle, heart, mammary gland, adipose, skin, esophagus, bladder, cervix, rectum, and testis cells. In one embodiment, the invention relates to diagnostic assays for detecting diseases assocd. with inappropriate NHP activity or levels. Also disclosed are methods for utilizing NHP in drug screening assays and in therapy directed against diseases assocd. with inappropriate NHP activity or levels.
